

CLY 558 xxxx Pole Shrouds Data Sheet

Clydesdale air gap pole shrouds are installed on new poles prior to erection near live power lines or to guard against pole contacts by personnel working in insulating aerial buckets or on platforms. The shroud is pulled open with rope handles and wrapped around the pole. The inherent shape and strength of the orange type I ABS, cold weather, impact resistant thermoplastic keeps the shroud firmly installed on the pole. The shroud has edge clips wrapped around and bonded to the edge of the guard meaning the shroud can be opened as wide as possible for easier installation and removal.

The pole shrouds feature a dimple design to create an air gap between pole and shroud for a number of benefits:

Decreased contact surface area thus increased insulating properties.

Air flow between pole and shroud to minimise rain water, condensation and contamination build-up.

Two or more shrouds can be interlocked with mating dimples.

The pole shrouds should be used for brush contact only with the opening facing away from possible line contacts. When not in use, they should be stored indoors to avoid prolonged UV exposure and can be cleaned using a warm detergent solution.
