

### DATASHEET: CLY 1006

### Overhead Line Rollers

The Clydesdale Running Earth employs a cast aluminium base with two main conductor rollers and a tensioning roller all running on ball bearings. The Running Earth is designed to be attached to a conductor between a drum trailer and the first pole during stringing operations. It is provided with an anchor point that can be connected with chain, rope or wire to the drum trailer chassis to hold the device in position as the conductor is paid out through it.

The running earth is connected to a temporary grounding point with standard earthing cables.

The device is used to protect the winch operator against stray voltages caused by induction, back feeding or lightning strikes.

Weight 2kg.
