Firefly Cross Arm mount

This product aims to extend the number of situations in which Clydesdale's "Firefly" bird hazing device can be deployed.

The Firefly is designed by a specialist in avian behaviour to provide a visual deterrent to birds. Unlike any other device the firefly is designed to use specific colours, materials and rotating frequencies to disturb birds and prevent them landing or roosting.

The Firefly is conventionally supplied with a clamp to allow it to be applied to overhead lines to prevent birds colliding with or roosting on them.

The bracket allows the Firefly to be suspended in the air above an installed cross arm. This ensures it is clearly visible to birds and prevents them from landing on the arm or any piece of infrastructure attached to the pole such as transformers and reclosers.

The clamp mechanism allows the device to be deployed using insulating sticks (i.e. hot sticks) so can be installed from the ground on to live networks to minimise cost and maximise safety.

The clamp is designed to accommodate both square and "L" section cross arms in a range of sizes from 50-125mm (2-5") and includes adapters to provide a secure fit in all situations.

Made from an incredibly durable, light and non conductive material the cross arm bracket is designed to be easily installed and remain in service for many years without maintenance.
